

# ESPL TMS Project Feature Report

Features available in the Transport Management System, how to use them, and practical day-to-day examples.

| Role               | Main Responsibility                                                                     | Real-Life Example                                                                                      |
|--------------------|-----------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Sys Admin          | Controls full platform access, settings, users, and overall monitoring.                 | A manager checks all trucks, drivers, invoices, compliance records, and business KPIs from one login.  |
| Dispatcher         | Creates trips, assigns drivers and trucks, manages route movement and dispatch records. | A dispatcher assigns a truck and driver to move 40 tons from plant to terminal.                        |
| Finance Officer    | Manages billing, invoices, salary entries, maintenance expenses, and exports reports.   | Finance enters driver salary, maintenance service cost, and downloads pending invoice Excel reports.   |
| Compliance Officer | Checks driver, vehicle, legal, safety, and document compliance.                         | Before dispatch, compliance verifies that license, insurance, permit, and fitness documents are valid. |

## Project Overview

The ESPL TMS website is a Transport Management System for logistics operations. It combines trip dispatch, fleet, drivers, finance, compliance, yard, weighbridge, maintenance, HR, inventory, and reporting into one digital platform.

In daily work, it reduces manual paperwork, prevents dispatch mistakes, improves visibility, supports billing reconciliation, and helps managers make faster operational decisions.

## Main Features

| Feature                         | How to Use                                                                                                                 | Real-Life Example                                                                               |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| Role-Based Login & Registration | Select a role first, then login or register. Users can only login with their assigned role.                                | A Finance Officer cannot login as Dispatcher using the same account, protecting sensitive data. |
| Executive Dashboard             | Open Dashboard to view gross billing, active trips, invoice exceptions, fleet utilization, revenue charts, and PO usage.   | A manager checks morning operations and sees active trips, billing, and alerts.                 |
| Fleet Control                   | Open Fleet Control Specs to add trucks, view status, filter availability, and monitor vehicle health.                      | A truck in workshop is marked as maintenance so dispatch does not assign it.                    |
| Driver Management               | Open Driver Duty Logs to search, add, edit, and view driver profiles, license data, safety score, salary, and duty status. | Dispatcher checks driver availability and safety score before trip assignment.                  |

|                           |                                                                                                                                  |                                                                                                  |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|
| Trip Dispatch & POs       | Create a trip by selecting purchase order, driver, truck, source, destination, and quantity.                                     | A 1,000-ton PO is consumed trip by trip, with allocated quantity tracked.                        |
| Yard & Bay Management     | Open Yard & Bay Queue, click Allocate Dock Bay, enter truck/trip details, and assign a bay.                                      | Terminal staff allocate arriving trucks to loading or unloading bays to reduce queue delays.     |
| Weighbridge               | View weigh tickets with gross, tare, net weight, truck plate, material, and linked trip.                                         | Net weight from weighbridge is used for invoice matching and delivery proof.                     |
| Billing & Finance         | Review invoices, add manual driver salary entries, add maintenance expenses, and export reports.                                 | Finance checks delivered quantity and approves payment after matching trip and weighbridge data. |
| Workshop & Maintenance    | Add repair or service records and track maintenance cost.                                                                        | A tyre replacement bill is recorded and later reviewed by finance.                               |
| HR & Payroll              | View employee and driver salary records, payroll entries, and manual employee details.                                           | HR prepares month-end payroll and shares salary information with finance.                        |
| Inventory                 | Open Store & Spare Inventory to check spare-part availability.                                                                   | Workshop checks whether required parts are available before repair.                              |
| Tyre Inspection           | Review tyre condition and inspection records.                                                                                    | Low tyre tread is identified before a truck goes on a long route.                                |
| Legal & Compliance        | Review legal records, compliance warnings, and risky documents.                                                                  | Expired permits are caught before dispatch to avoid penalties.                                   |
| Excel Export              | Use Export Excel in sections, apply filters/search, and download section data.                                                   | Finance filters pending invoices and downloads an Excel sheet for accounts.                      |
| Mobile Responsive UI      | Open on mobile, use menu navigation, and scroll wide tables where needed.                                                        | A travelling manager checks operations from phone.                                               |
| Performance Optimizations | The app uses pagination, server-side filtering, dashboard caching, request caching, lazy charts, and database index preparation. | Many users can open dashboards and lists with less pressure on the database.                     |

## Day-to-Day Workflow

| Step | Activity                                                                                          |
|------|---------------------------------------------------------------------------------------------------|
| 1    | Sys Admin manages access and monitors the whole system.                                           |
| 2    | Dispatcher creates a trip using purchase order, driver, truck, source, destination, and quantity. |
| 3    | Yard team allocates the arriving truck to a dock bay.                                             |

|   |                                                               |
|---|---------------------------------------------------------------|
| 4 | Weighbridge records gross, tare, and net weight.              |
| 5 | Compliance checks driver and truck document validity.         |
| 6 | Finance verifies invoice, salary, and maintenance entries.    |
| 7 | Manager reviews KPIs and downloads Excel reports for records. |

## Conclusion

The ESPL TMS website is a complete logistics management platform. It helps organize trucks, drivers, trips, billing, compliance, yard activity, weighbridge records, inventory, maintenance, payroll, and reports from one place.

For real-life transport operations, this improves control, reduces paperwork, avoids missed compliance issues, and gives management faster visibility into daily business activity.
